

Object-Oriented Analysis and Design using UML and Patterns

Clean Architecture

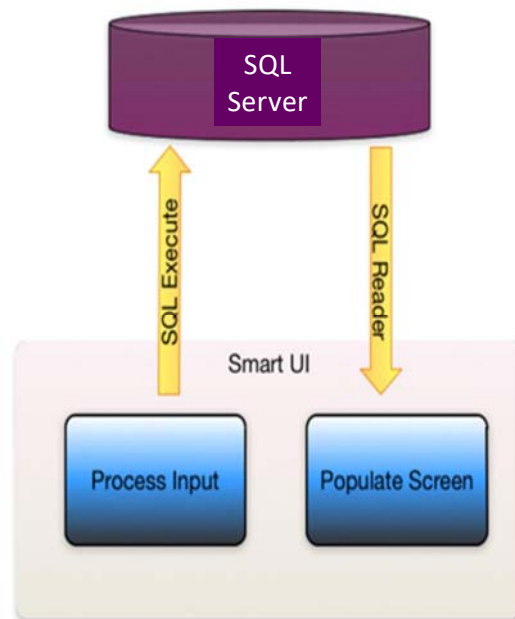

1

CRUD-based Workflow

2

Smart UI Anti-Pattern

3

From Simple to Complex, but Flexible

- Transactional Script
 - GUI talks to DB directly
 - No Domain Model
- Active Record
 - An object is a wrapper for row in DB with minimal logic and basic CRUD.
 - Anemic Domain Model
- Data Mapper
 - Complete separation between domain and data source
 - On to “Rich Domain Model”

4

Focus On The Domain Problem

5

Isolating the domain

If an architecture isolates domain related code and logic in a single layer such that ...

- It is strongly cohesive
- Loosely coupled with the rest of the system
- Can perform tasks related to the domain concepts or policies delegated from other layers/interfaces.

Then such an architecture is capable of support domain driven designs.

6

Traditional Layered Architecture

- Each layer should be strongly cohesive.
- Each layer may couple only to itself and below.
- There is never a direct reference from lower to higher
- Lower layers may actually loosely couple to higher layers, but this is only by means of a mechanism such as callbacks or Observer pattern.

Typical Layers

User Interface (Presentation Layer)	Responsible for presenting information to the user and interpreting user commands.
Application Layer	This is a thin layer which coordinates the application activity. It does not contain business logic. It does not hold the state of the business objects, but it can hold the state of an application task progress.
Domain Layer	This layer contains information about the domain. This is the heart of the business software. The state of business objects is held here. Persistence of the business objects and possibly their state is delegated to the infrastructure layer.
Infrastructure Layer	This layer acts as a supporting library for all the other layers. It provides communication between layers, implements persistence for business objects, contains supporting libraries for the user interface layer, etc.

9

Dependency Inversion Principle (DIP)

*High level modules should not depend upon low level modules.
Both should depend on abstractions.
Abstractions should not depend upon details. Details should depend upon abstraction.*

Flexible, extensible, reusable

10

DIP Applied Layered Architecture

What Happened?

Martin's slides

13

Use Cases

Create Order

Data:

**<Customer-id>, <Customer-contact-info>,
<Shipment-destination>, <Shipment-mechanism>,
<Payment-information>**

Primary Course:

1. Order clerk issues "Create Order" command with above data.
2. System validates all data.
3. System creates order and determines order-id.
4. System delivers order-id to clerk.

Exception Course: Validation Error

1. System delivers error message to clerk

Robustness Analysis:

What objects participate in each use case?

Draw an “**object picture**” of the use case

Use the **boundary/control/entity** stereotypes

15

Analysis Objects

- Boundary class
 - Interfaces between system and its environment
- Entity Class
 - Application-independent business rules
 - Represents the key concepts of the system
- Controller Class (aka, Controller)
 - Application-specific business rules
 - Use-case behavior coordinator

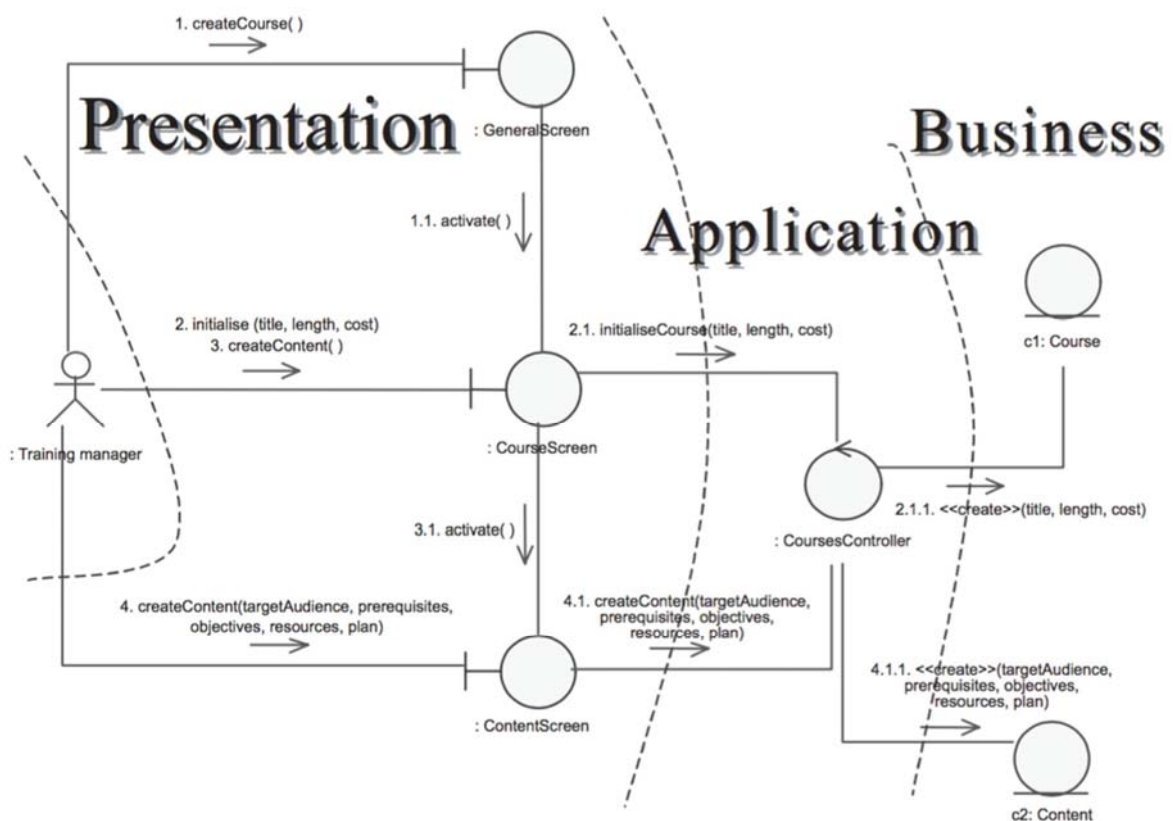

16

Find Analysis Classes from Use Case

The complete behavior of a use case has to be distributed to analysis classes

17

18

Interactors

Interactors have: Application specific business rules

19

Entities

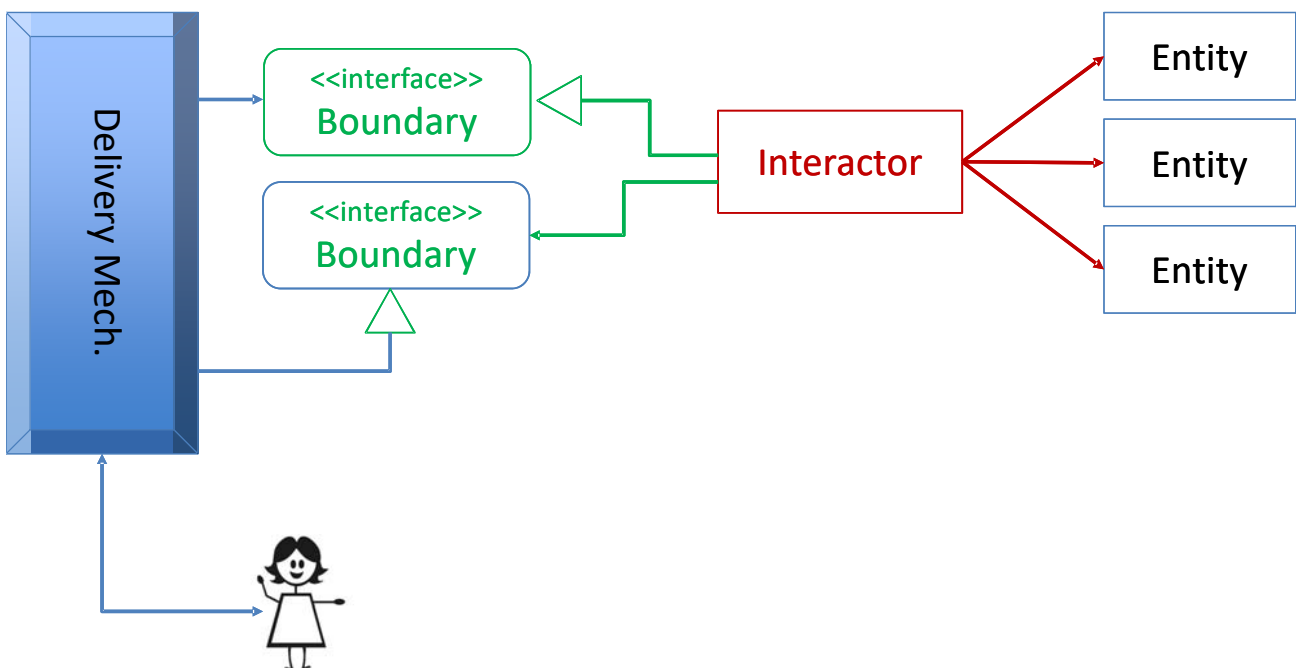

Entities have: Application independent business rules

20

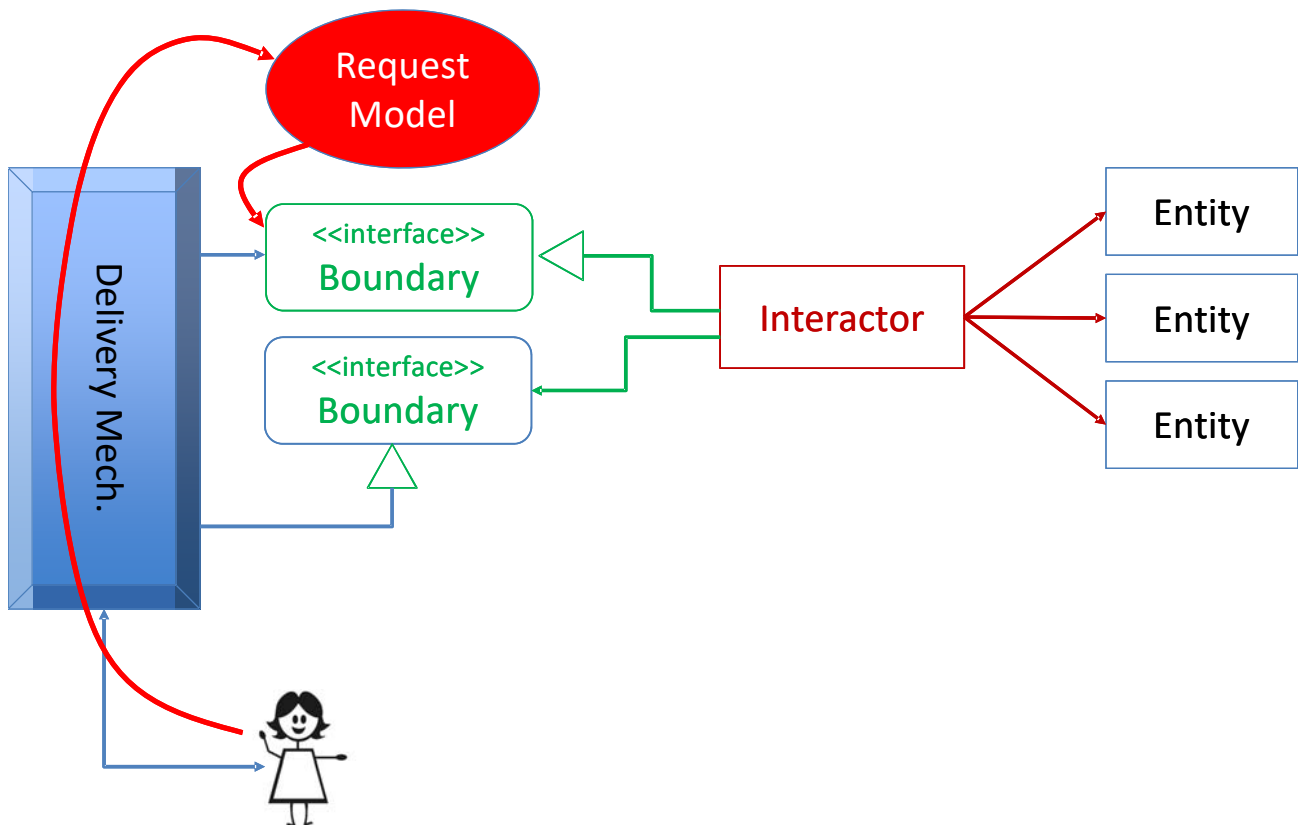

Boundaries

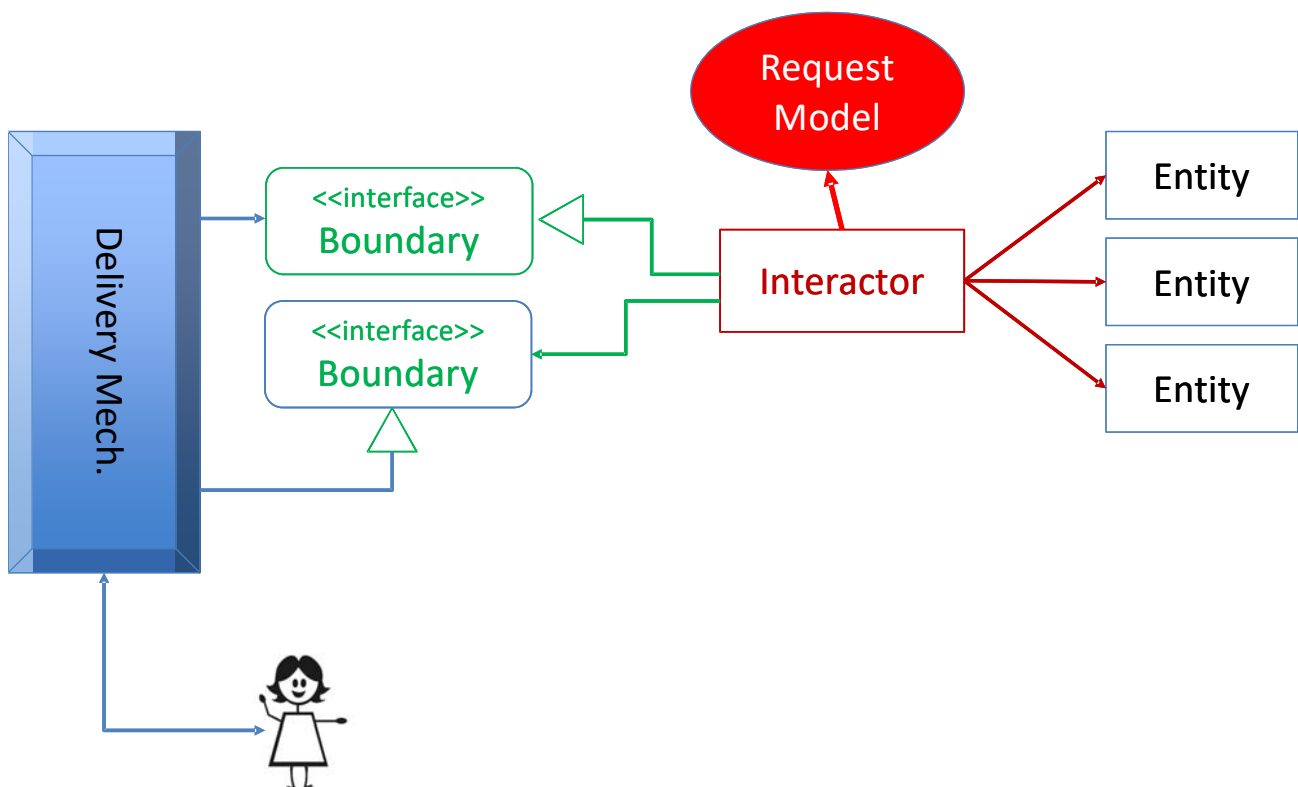

21

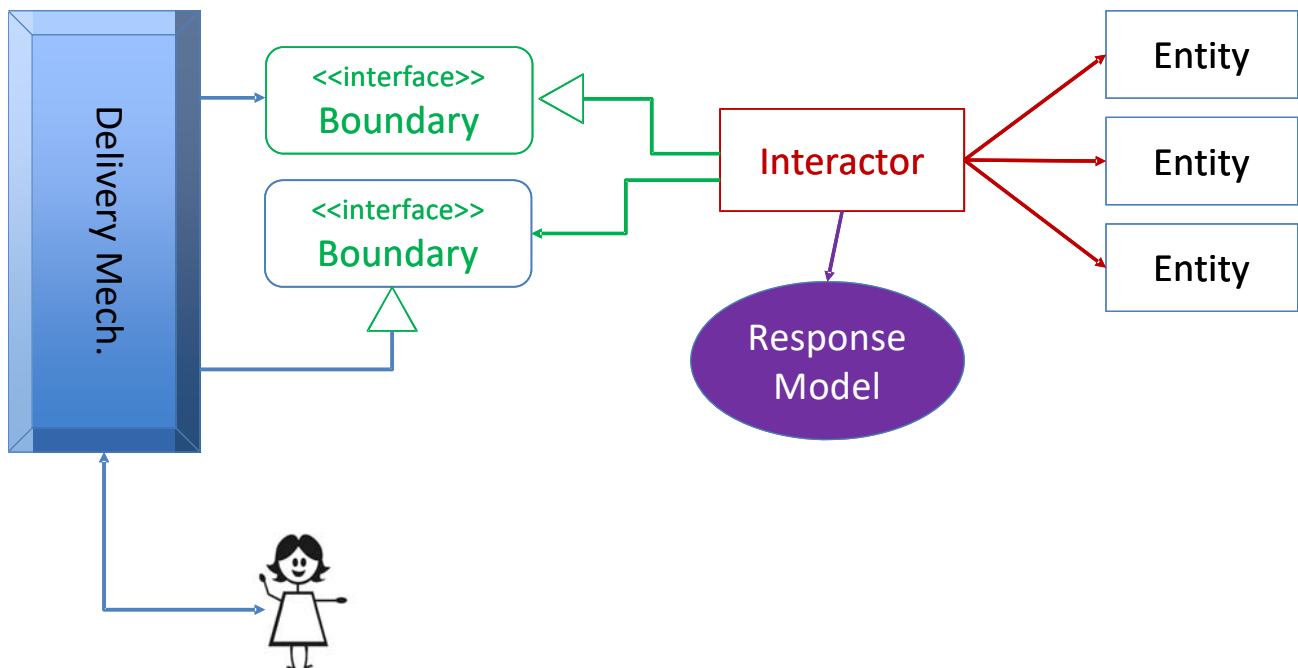

22

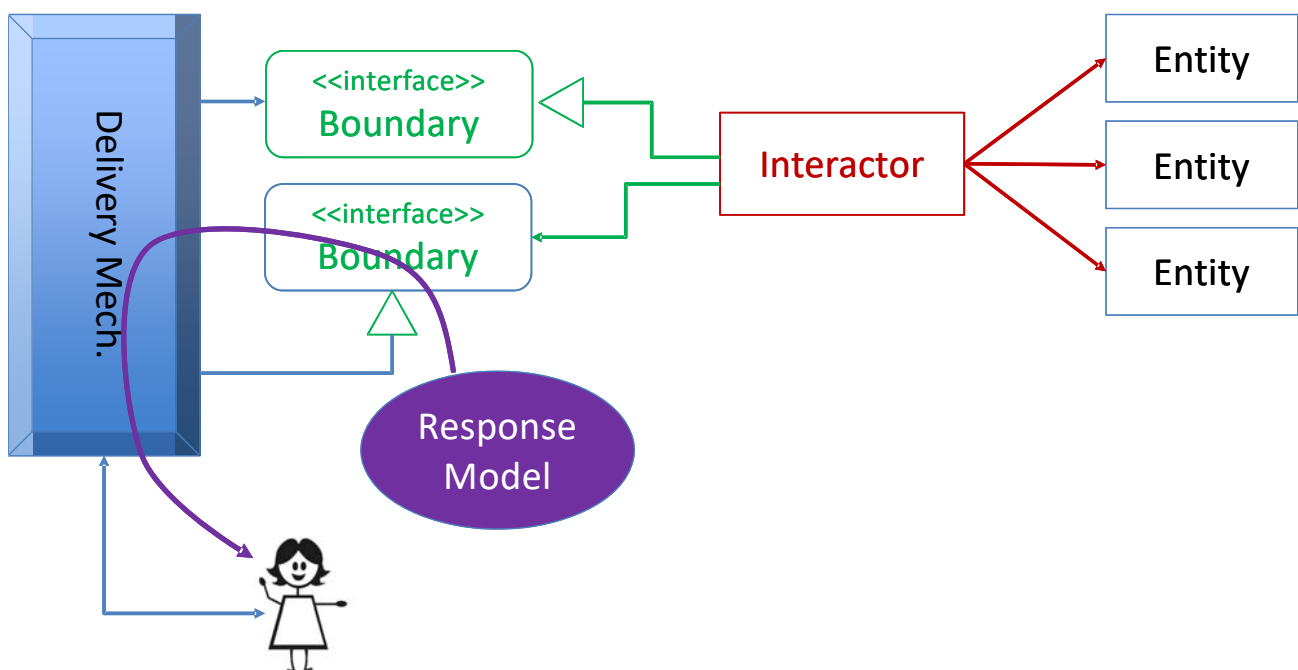

23

24

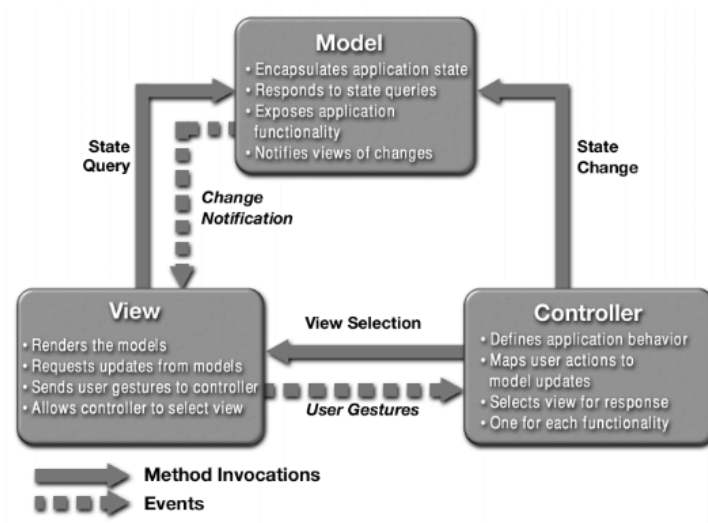

25

26

Model-View-Controller

Model

Contains business logic

View

Interacts with **Model** to
create data for **View**

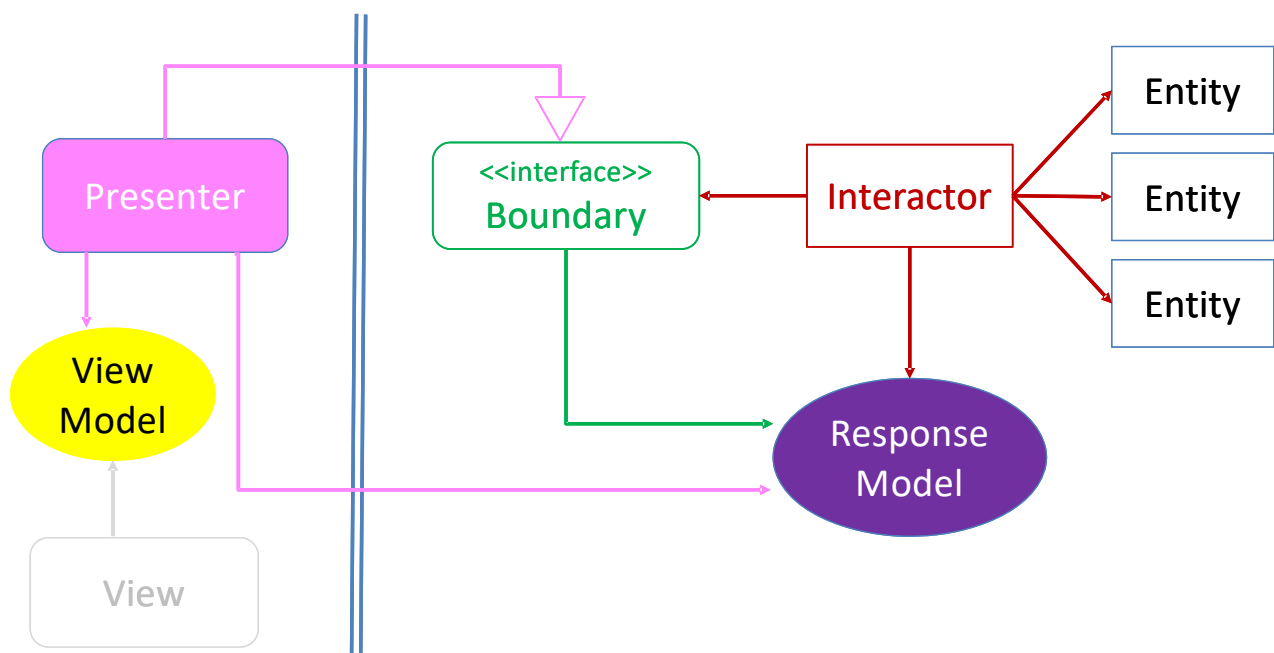

Controller

Renders contents and relays use commands to the **Controller**

MVC is a delivery mechanism

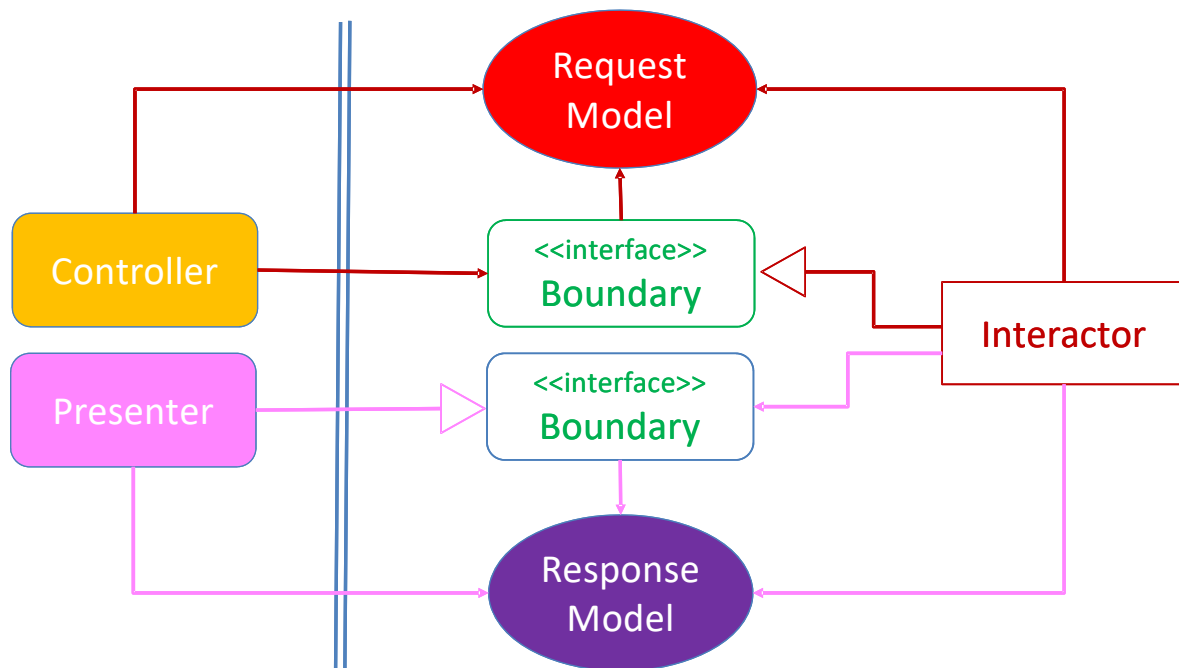

27

Model View Presenter

29

WHOLE ENCHILADA!

30

What about Database?

30

Martin's slides

32

DB is a detail... Isolate It!

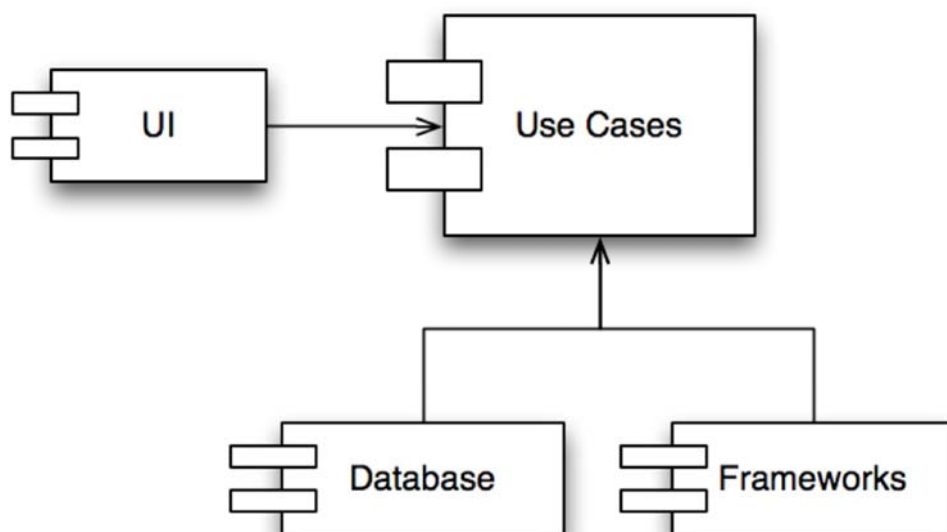

Martin's slides

32

**A good architecture allows
major decisions to be deferred!**

**A good architecture maximizes
the number of decisions NOT
made!**

PLUG-IN Model

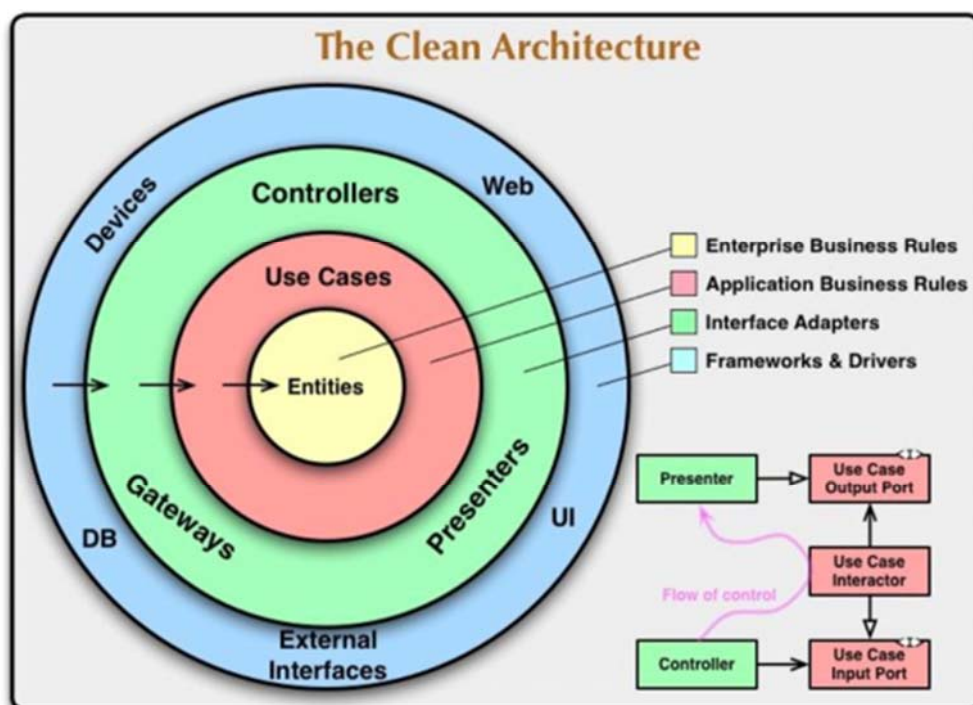

Definition of Clean Architecture

- Independent of Frameworks
- Testable
- Independent of UI
- Independent of Databases
- Independent of Any External Agencies

<http://blog.8thlight.com/uncle-bob/2012/08/13/the-clean-architecture.html>

35

Clean Architecture

36

Layers

As you move inwards the level of abstraction increases.

- Entities
 - Domain Layer
- Use Cases
 - Application Layer
- Interface Adapters
 - Presentation Layer (UI-level MVC)
- Frameworks and Drivers
 - Infrastructure Layer

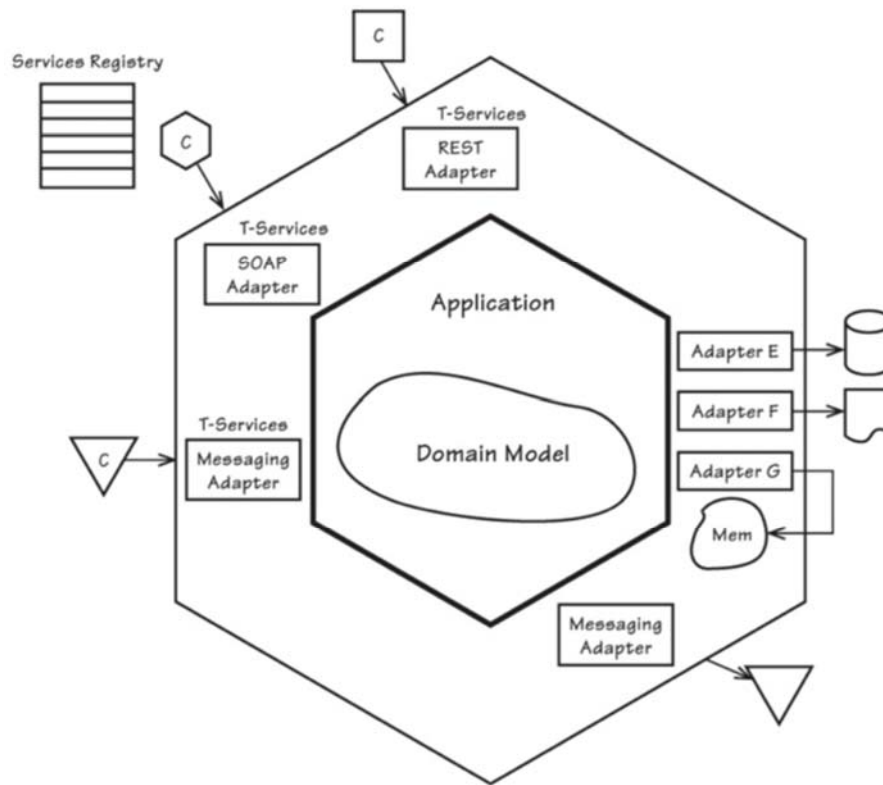

37

Cousins

All based on Separation of Concerns

- Hexagonal Architecture (a.k.a Ports & Adapters)
 - Alistair Cockburn
- Onion Architecture
 - Jeffrey Palermo
- Scream Architecture
 - Uncle Bob
- DCI (Data, Context, and Interaction)
 - James Coplien, and Trygve Reenskaug
- BCE (Boundary-Controller-Entity)
 - Ivar Jacobson

38

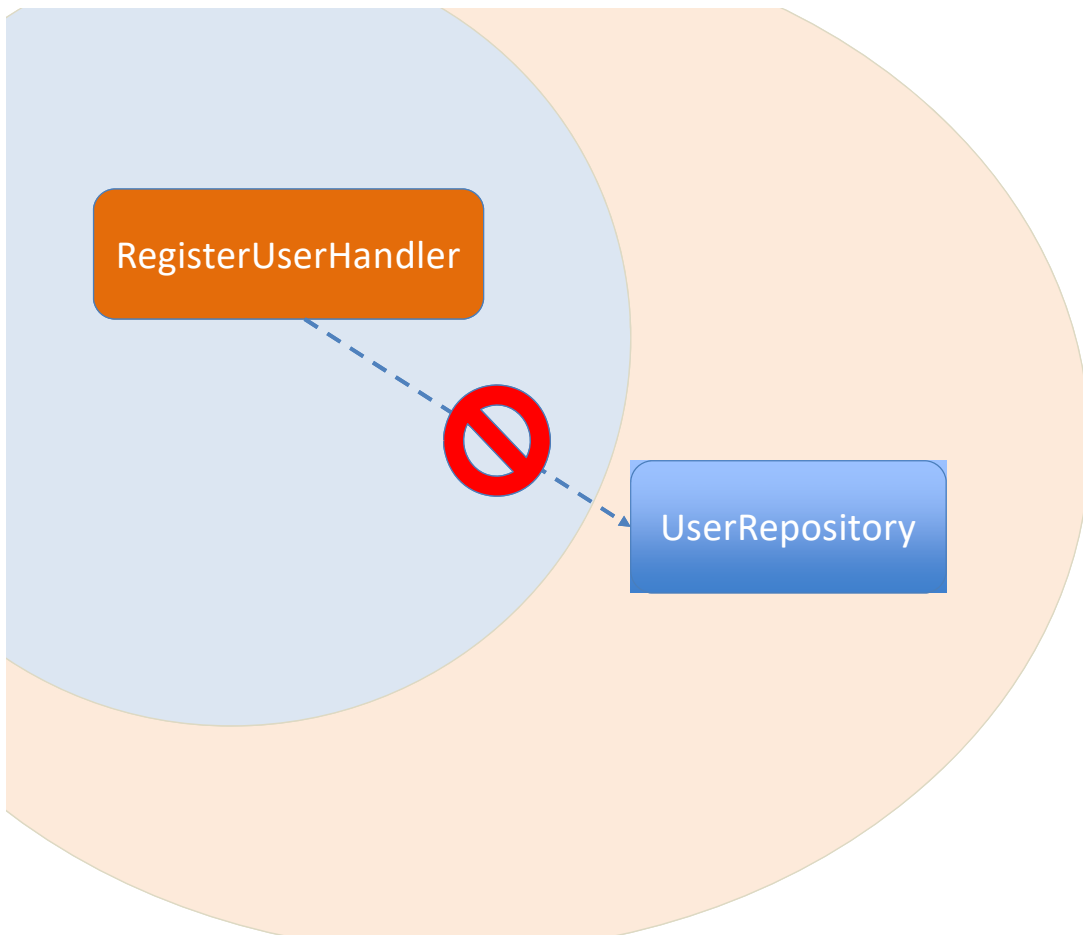

39

Dependency Rule

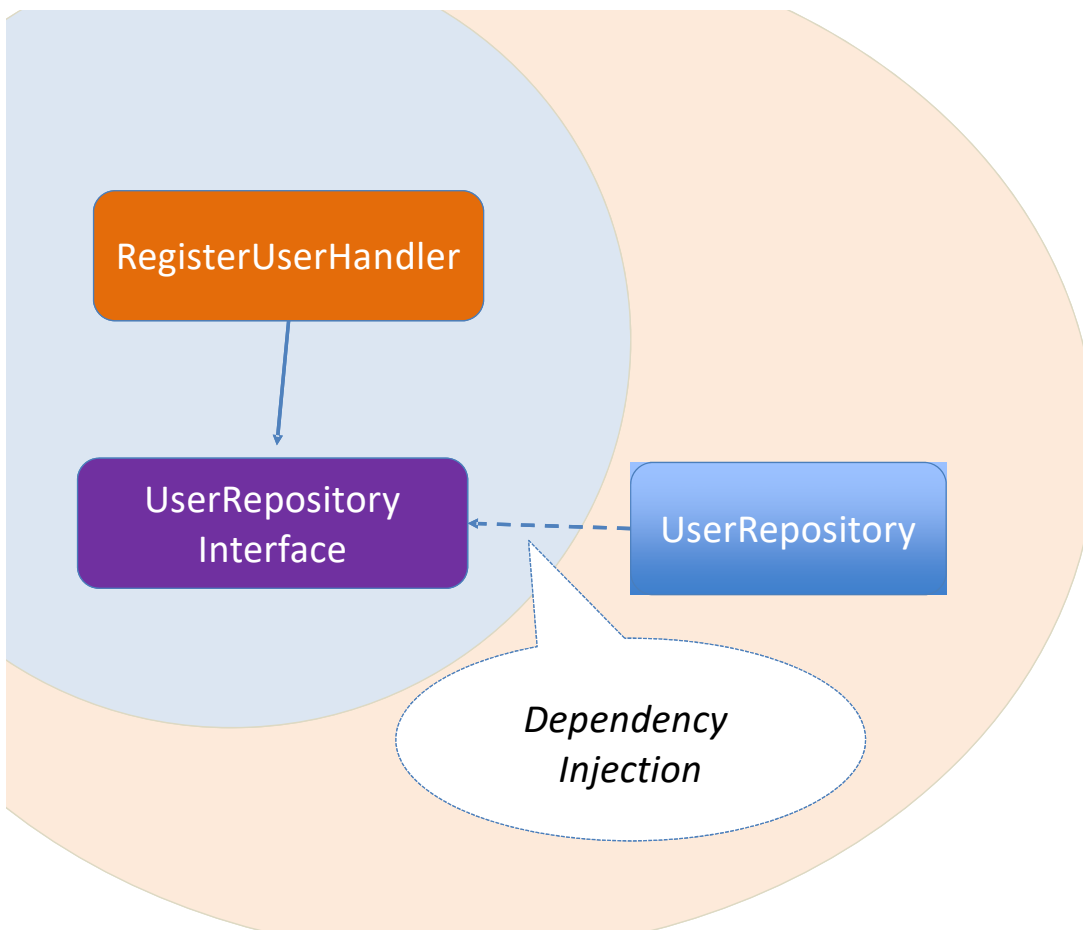

“Source code dependencies can only point inwards. Nothing in an inner circle can know anything at all about something in an outer circle.”
